

# T-REX Unit E-ELT HIRES

L. Origlia, E. Oliva, F. Zerbi, S. Cristiani  
INAF, Italy

R. Maiolino

Cavendish Lab & Kavli, Cambridge, UK

# T-REX Unit for the E-ELT HIRES

## past milestones ...

- ◆ **oct 2011**: given the new E-ELT/instrument roadmap & X-Shooter success the PIs, PMs & PSs of the CODEX (opt) & SIMPLE (IR) Phase-A studies met in Garching to start discussion (scientifically first and then technically) about the interest/opportunity for a **high/medium res spectrograph** with **simultaneous wide spec coverage** from **opt to IR** wavelengths
- ◆ **nov 2011**: letter to M. Casali to inform ESO about HIRES activities
- ◆ **sept 2012**: **scientific workshop on E-ELT HIRES** in Cambridge
  - ✓ involvement of the whole European high res spectroscopic community
  - ✓ explored all science cases from planet atmospheres to stars & stellar pop out to the high-z Universe and fundamental constants
  - ✓ white paper with science cases and top level requirements (being written)

# T-REX Unit for the E-ELT HIRES

Cambridge workshop: Towards the science case for E-ELT HIRES

Presentations

12/17/12 5:02 PM

Presentations

12/17/12 5:02 PM

## Presentations

Haehnelt & Maiolino: [Welcome and introduction](#)

### E-ELT PROJECT STATUS and OTHER FORTHCOMING HIGH RESOLUTION SPECTROGRAPHS

Liske: [E-ELT project status](#)

Szentgyorgyi: [G-CLEF: A General Purpose Optical Echelle Spectrograph for the GMT](#)

Da Costa: [GMT instrument development](#)

Pepe: [ESPRESSO, a taste of high-resolution spectrographs on extremely large telescopes](#)

Strassmeier: [The PEPSI high-resolution spectrograph for the Large Binocular Telescope](#)

### E-ELT HIRES SCIENCE CASES: STELLAR SPECTROSCOPY and YOUNG STARS

E. Tolstoy: [Chemistry and Kinematics of Stellar Populations](#)

de Laverny: [Stellar evolution and galactic archaeology with ELT/HIRES: some possible projects](#)

Gustafsson & Korn: [Raising the bar on stellar abundances: why and how?](#)

Larsen: [Detailed chemical abundance analysis of semi-resolved stellar populations](#)

Testi: [Disk-star interaction and evolution at the time of planet formation](#)

Origlia: [Summary of requirements and discussion](#)

### E-ELT HIRES SCIENCE CASES: HIGH REDSHIFT GALAXIES and COSMOLOGY

Petitjean: [The interconnection between galaxies and the IGM](#)

Fynbo: [Spectroscopy of Gamma-ray Burst Afterglows](#)

Tanvir: [IGM and ISM in high-z galaxies through HIRES observations](#)

Cimatti: [Observing the different phases of the formation and evolution of massive galaxies](#)

Bunker: [High resolution at high redshift - galaxy evolution with HIRES/ELT](#)

Murphy: [Fundamental physics and cosmology with E-ELT quasar spectroscopy](#)

Cristiani: [Summary of requirements and discussion](#)

### E-ELT HIRES SCIENCE CASES: EXOPLANETS

Gillon: [Transiting planets atmospheric studies](#)

Lovis: [Science requirements for the characterization of exoplanet atmospheres](#)

Snellen: [Exoplanet atmosphere characterization at high spectral resolution](#)

Santos: [Prospects for the detection of reflected light from other worlds](#)

Udry: Radial Velocity Follow-up of terrestrial transiting planets

Queloz: [Summary of requirements and discussion](#)

### E-ELT HIRES: SUMMARY and DISCUSSION

Pasquini: [summary of science requirements](#)

Oliva & Delabre: [Technical issues](#)

Maiolino & Haehnelt: [Brief summary and next steps \(white paper\)](#)

➤ 90 participants even without advertising the workshop on the CADC server

➤ nice agreement among the different communities on the top level requirements and on the basic instrument concept

# T-REX Unit for the E-ELT HIRES science top level requirements

## ◆ target sizes & spatial resolution:

- mostly point sources (stars, exo-planets, QSOs) or moderately extended ( $\sim 1''$  galaxies)  $\rightarrow$  seeing/GLAO PSF
- sub-structures at  $\sim 10$ mas scale (CS disks): DL in K
- point sources in very crowded fields:  $\sim$  tens mas

## ◆ spectral range & coverage in one exposure:

- as wide as possible
- simultaneous 0.37-2.45 micron highly desirable for complete line diagnostics & redshift coverage

## ◆ spectral resolution(s) & multiplexing:

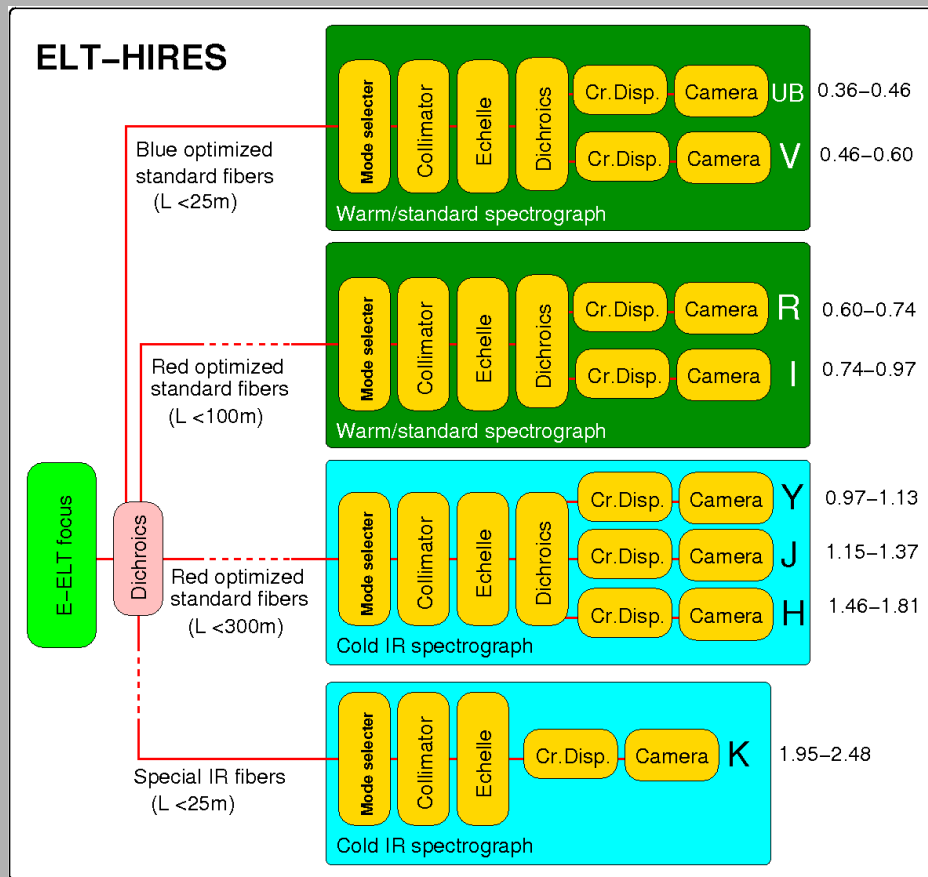

- $R \geq 100k$  + single obj  $\rightarrow$  exo-planets & chemical evol (stars, IGM)
- $R \sim 10k$  + 10 obj  $\rightarrow$  stellar pop, galaxy evolution, IGM tomography
- $R \sim 100k$  + IFU/MOS at  $\sim$ DL  $\rightarrow$  CS disks, dense stellar fields

# T-REX Unit for the E-ELT HIRES

a possible instrument concept (Oliva & Delabre)

- Fundamental approach: highly modular concept within reasonable technological limits.
- Modules and observing modes may be added or removed following a trade-off study between scientific priorities & tech/cost constraints.

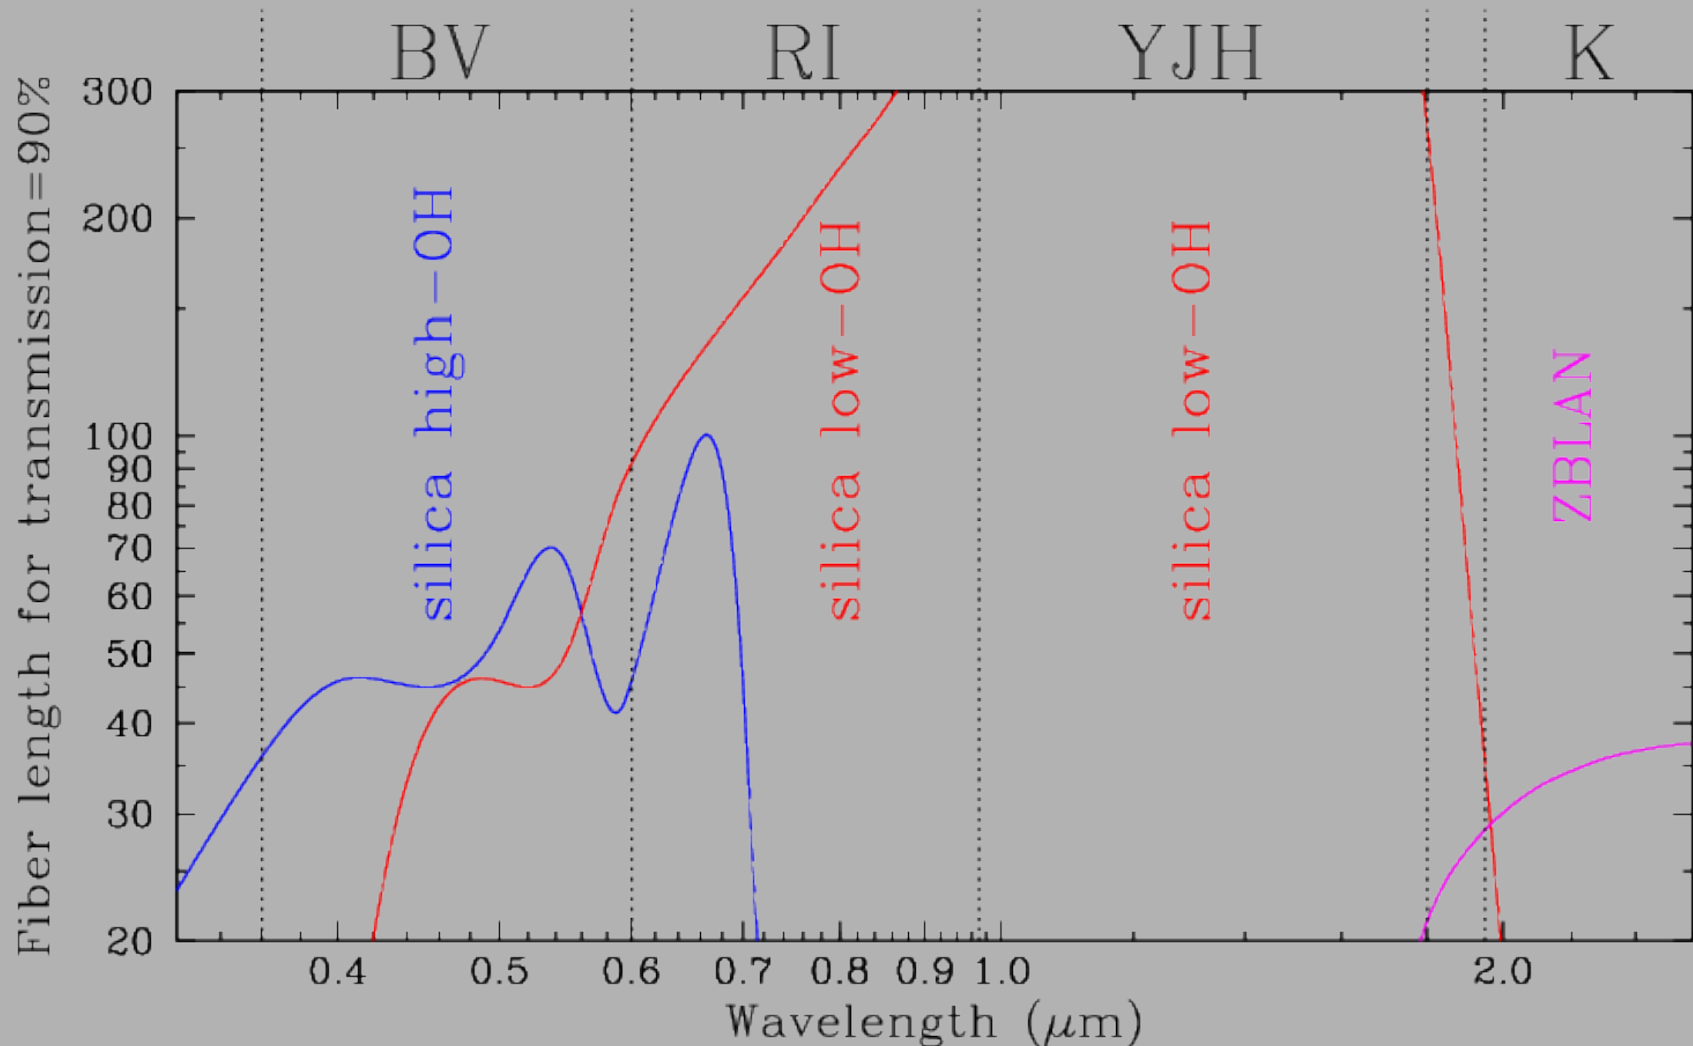

- 4 independent fiber-fed modules (i.e. spectrometers) optimized over 4 spectral ranges (UBV, RI, YJH, K).
- Different observing modes are obtained using different and independent groups of fibers feeding each spectrometer.
- Observing mode is selected in the pre-slit section (fore-optics) of each module. No change inside the spectrometers.

# T-REX Unit for the E-ELT HIRES

fibers → independent location of each spectrograph on the platform/other rooms

# T-REX Unit for the E-ELT HIRES

## possible observing modes ...

- pseudo-slit of 11" (138 pix) along the spatial direction Y
- Y-pixels can be used for slicing (HR) or MOS/IFU
- spectral format (cross-dispersed) is fixed, the same for all observing modes
- different slit-widths (0.13" at R = 100,000) are used to achieve different spec res

# T-REX Unit for the E-ELT HIRES

## possible observing modes ...

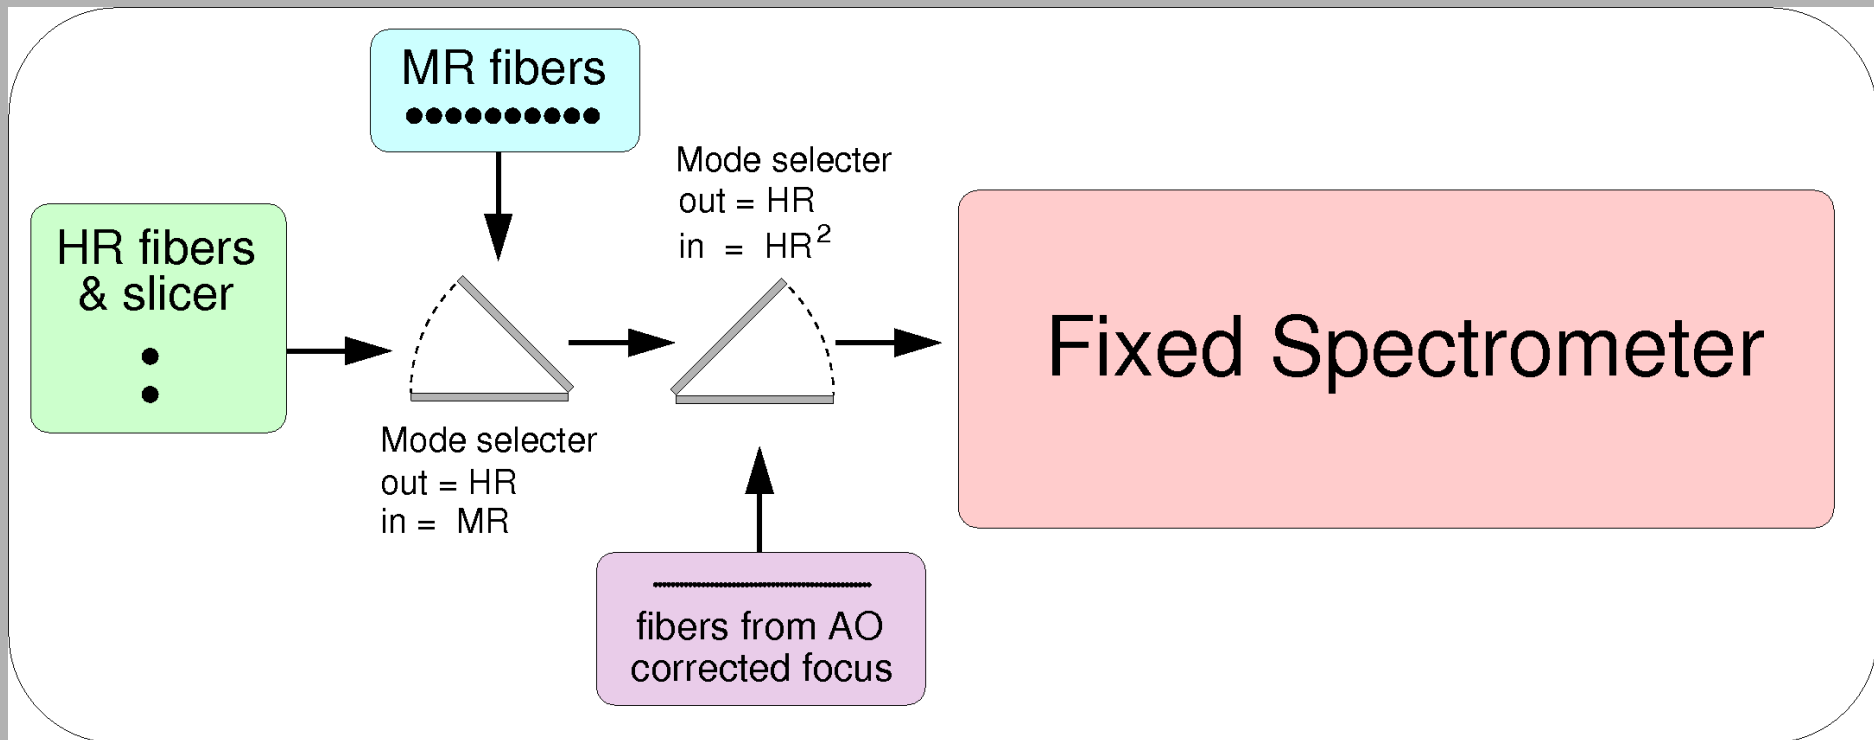

Mode	R	D-fib	N.obj	Size of Res. Element		Comment
				sky	pixels	
HR	100,000	0.76"	2 + $\lambda_{cal}$	0.127" x 5.0"	2.8 x 63	1x6 slicing
MR MOS	14,500	0.86"	10	0.86" x 0.86"	20 x 11	MOS on ELT 10' fov
HR <sup>2</sup> IFU	80,000	7mas	35	7mas x 7mas	3.5 x 2	SCAO fov 35x49 mas
<i>Other options</i>						
HR <sup>2</sup> MOS	80,000	0.030"	35	.030" x .030"	3.5 x 2	MOS on MCAO 2' fov
LR MOS	7,000	0.89"	16	1.79" x 0.45"	40 x 6	2x1 slicing

- MR-MOS for all modules/wavelengths with full spec coverage
- HR<sup>2</sup> MOS/IFU only in IR where AO works
- patrol field of MOS depends on where the fibers positioner is located
- possible parallel modes, e.g. MR-MOS in optical while HR in IR on a single object

# T-REX Unit for the E-ELT HIRES scheme of a spectral module

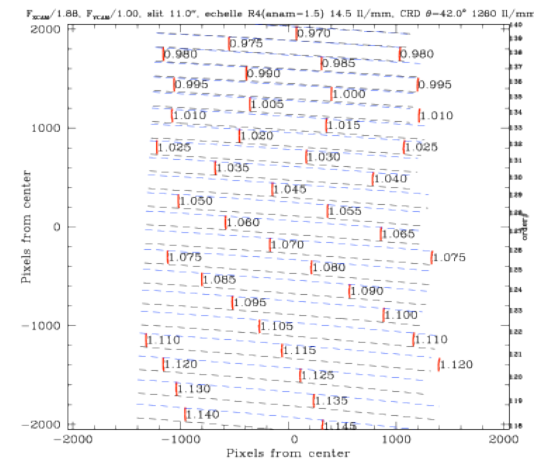

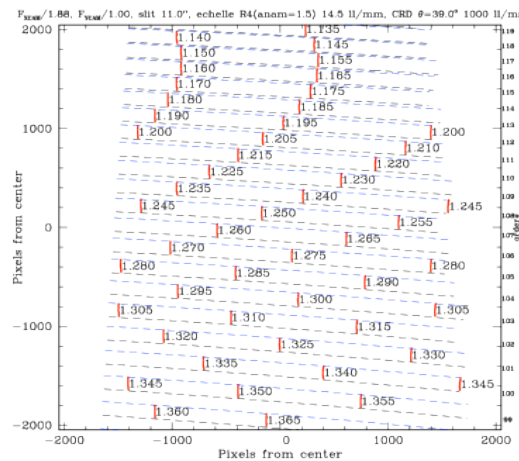

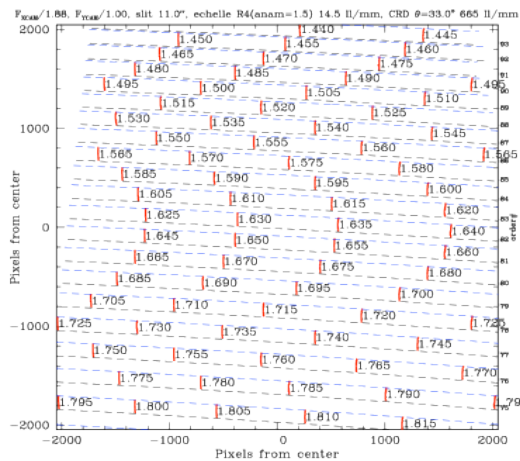

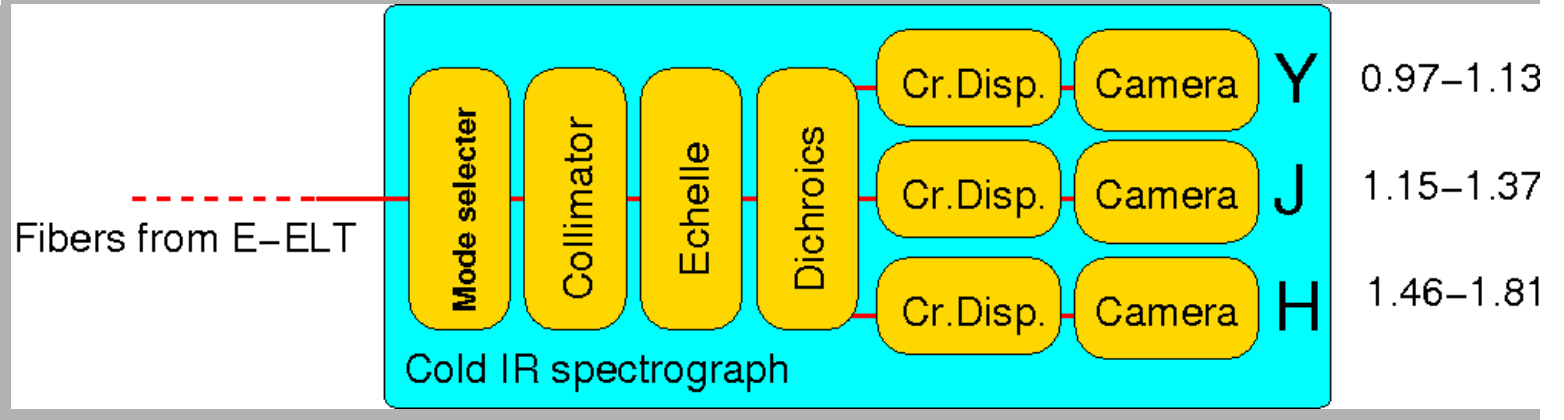

HR mode has fixed optics  $\rightarrow$  stability OK

# T-REX Unit for the E-ELT HIRES

## YJH module: cross dispersed spectral format

**H** 1.45-1.81  $\mu\text{m}$   
orders 74-93

**J** 1.16-1.38  $\mu\text{m}$   
orders 99-119

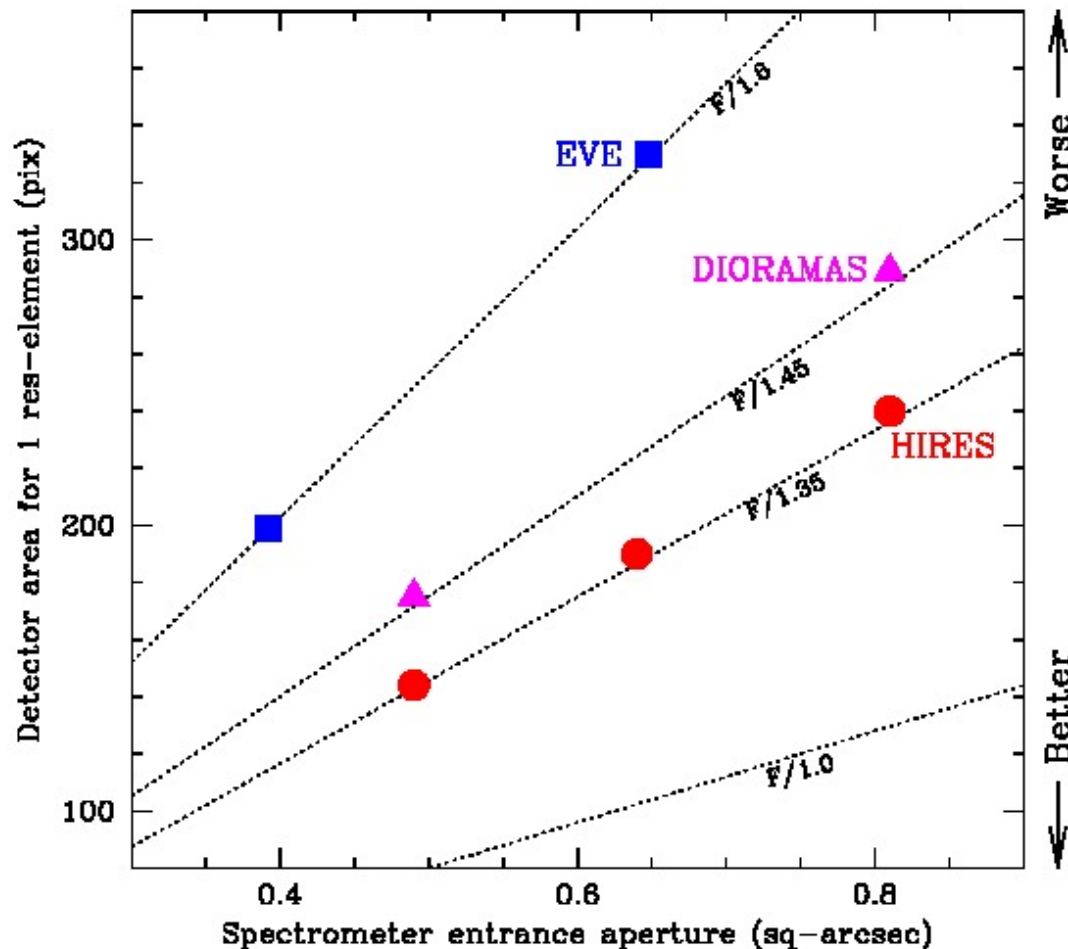

**Y** 0.97-1.14  $\mu\text{m}$   
orders 118-140

# T-REX Unit for the E-ELT HIRES

## HIRES vs other MOS

$$A\Omega = \text{constant} \rightarrow N_{\text{pix}} = 160 (\theta'')^2 F^2$$

the large E-ELT aperture  
&  
the small pix size (15  $\mu\text{m}$ )

necessarily imply

seeing/GLAO aperture  
spreads over many pixels

**HIRES**

fastest camera  $\rightarrow$   
lowest # of pix

# T-REX Unit for the E-ELT HIRES

## funding ...

- 4 FTEs (new contracts) & some travel support for 2013
- request for additional financial support in the next years

## forthcoming activities ... next 2 months...

- **jan23-24, 2013** → HIRES Italian workshop in Trieste

much scientific & technical interest/expertise in medium-high res spectroscopy

Sarg, Harps-N & Giano @ TNG

XShooter, Espresso, Cires & Moons @ VLT

- ✓ design, integration, tests, R&D of cryo-opto-mech systems
- ✓ design & development of low/high level software & control electronics
- ✓ R&D of fibers and related fore optics
- ✓ design, integration, tests of SCAO interfaces

- **feb19, 2013** → HIRES kickoff meeting in Cambridge

- **feb25-mar01, 2013** → Shaping E-ELT Science and Instrumentation at ESO
